WORK MANUAL FOR FLOOR SOFT SOAP

www.selder.com

15.3.2021

After treating wooden floors with FLOOR SOFT SOAP, a protective coat of soap is formed, which dissolves when the floor is wiped with water. One soap treatment is sufficient for 30-50 wipes. The floor will pale more and more over time as it's wiped with water.

Oak is particularly prone to becoming pale, as the oxalic acid in the wood reacts with the soft soap. A dark-brown to black surface appears, which is then wiped off with water.

Apply FLOOR SOFT SOAP using a wide brush. Move from saturated areas to areas still absorbing soft soap. Proceed until the whole area is saturated, then remove the excess soft soap. After the surface is entirely dry, polish or wipe with cold water. When it starts to become difficult to remove dirt, scrub the floor clean and let it dry. Apply soft soap as described above.

Keep in mind that FLOOR SOFT SOAP dissolves linseed oil paints and attacks aluminum.

WORKER PROTECTION

Soft soap dries out the skin. Use gloves when working with soft soap. Mind your eyes, as the soft soap is a potent irritant.
